

Table 3. Plant-Back Restrictions for Forage Cover Crops after Pre-Emergence Herbicide Applications in Soybeans

All numbers represent months. A zero indicates no replant restrictions following herbicide application. If a box for a herbicide-species combination has a dash, the restriction is too long to allow for planting of that forage cover crop species within the same growing season as the corn crop.

Herbicide	Cool-Season Species											Warm-Season Species				
	Annual Ryegrass	Barley	Cereal Rye	Clover	Field Pea	Oats	Radish	Triticale	Turnip	Vetch	Wheat	Chickpea	Cowpea	Pearl Millet	Proso Millet	Sorghum

See footnotes on next page.

-
- ^a Wheat may be planted when Anthem is applied at less than 9.75 oz/ac. Field pea may be planted when Anthem is applied at less than 3.25 oz/ac.
- ^b Wheat may be planted when Anthem Maxx is applied at less than 4.875 oz/ac. Field pea may be planted when Anthem Maxx is applied at less than 1.625 oz/ac.
- ^c Intervals for cereal rye and wheat are 18 months for Minnesota and North Dakota, north of Highway 210. Do NOT feed treated soybean forage or hay to livestock.
- ^d Do not graze or harvest for food or feed cover crops planted less than nine months after treatment with Command.
- ^e Peas may be planted immediately following application when Command is applied at less than 0.5 lb/ac; otherwise, the interval is nine months.
- ^f Intervals are for rates of Dual II Magnum applied at NOT more than 1.33 pint/ac. A second application or other herbicides containing S-metolachlor is prohibited when planting forage double crops in the fall.
- ^g When applied at a rate of 3.2 pts/ac.
- ^h This will restrict the post-emergence application of Pursuit in soybean if growers intend to plant alfalfa, cereal rye, clover, or wheat in the fall.
- ⁱ A rotational interval for most cover crops is four months if soil is tilled prior to planting, and eight months if no tillage is performed. See herbicide label for instructions.
- ^j Can be applied at 1 fl oz/ac if the organic matter content of the soil is less than 2%. This herbicide will provide limited broadleaf control at this rate. Coarse soils with less than 2% organic matter require a minimum preplant interval of 30 days for planting soybean.
- ^k Rotation intervals for Valor SX vary depending on the applied rate of herbicide; see label for full restrictions.
- ^l Valor XLT in Nebraska can only be applied in soybean fields south of Route 30 and east of Route 281.
