

VARIEGATED CUTWORMS

A number appearing at the bottom of a colored box are moths trapped during the nights highlighted by color
 Note: **Bolded numbers** indicate substantial moth flight for a single or several night sequence

Although Nebraska threshold levels not been developed based on moth catches, some states have thresholds suggesting that large and continual catches greater than 25 per week will result in similarly large populations of variegated cutworm caterpillars being observed approximately 2 weeks following peak trap counts.

ARMYWORMS

A number appearing at the **bottom** of a **colored box** are moths trapped during the nights highlighted by color

Note: **Bolded numbers** indicate highest numbers of moth flight for a single or 2 night sequence.

Nebraska thresholds not established, however some states indicate scouting threshold of 100/trap/7 day period

Black cutworms (moths/night)

A number appearing at the bottom of a colored box are moths trapped during the nights highlighted by color
 Note: **Bolded numbers** indicate substantial moth flight for a single or 2 night sequence (8 or more moths over 2 consecutive nights)
