

# Nebraska Soil Science Curriculum

## Soil Respiration

Approximately 180 minutes

\*\*\*Content and lab derived from the USDA-NRCS Guides for Educators. Please see the Guides for additional helpful pictures and diagrams.\*\*\*

### Objectives

By the end of the lesson, students will know or be able to:

- Define: soil respiration and soil microbes
- Explain the role of soil respiration in determining soil health
- Diagram the role of soil respiration in the cycle of life on earth
- List and explain inherent factors that affect soil respiration
- List and describe soil respiration management processes
- Interpret management impacts on soil respiration and soil organic matter
- Measure soil respiration and interpret data

### Materials

- Lab materials (see Lab Guided Notes)
- Baggie that seals
- Plant cutting

### Preparatory Work

- Place a plant cutting in a plastic baggie several hours prior to teaching this lesson so that respiration is visible

### Enroll the Participants – approximately 4 minutes

Show or pass around the sealed baggie with the plant cutting inside of it. Inquire to students as to what they know about why the water droplets formed inside of the baggie even though you placed only a plant cutting inside of the baggie.

Hold up the second (empty) plastic baggie and breathe into it to demonstrate the formation of water droplets because of your breath. Again, inquire about what students know.

Content to share:

- Living organisms conduct the process of respiration.
- It's easy to see signs that a human is breathing (a rising chest or abdomen, sound of breathing, feel of breath, etc.)
- We can see that plants are breathing through the cutting in the baggie

### Provide the Experience – Key Terms and Soil Health – approximately 5 minutes

Separate students into small groups of three or four.

Provide each small group with a soil sample. (It will be helpful if some of the samples have bugs, worms, crop residue or other living organisms in them.)

Instruct small groups to investigate their soil and determine what in the soil affects the respiration that occurs in the soil.

Elicit student responses.

### Label the Information – approximately 4 minutes

Direct students to their guided notes and encourage them to capture the following information.

- Soil respiration is a measure of the carbon dioxide released from the soil by microbes decomposing soil organic matter and from the respiration of plant roots.
- Soil respiration indicates soil health (soil organic matter content, soil organic matter decomposition and the level of microbial activity).

- Soil Microbes: Soil organisms that are responsible for soil respiration and many important soil processes such as nutrient cycling.
- Respiration: Release of carbon dioxide from several sources (decomposition of soil organic matter by soil microbes, and respiration from plant roots).
- Mineralization: Organic matter decomposition releasing nutrients in a plant available form that occurs during respiration.
- Ammonification: Production of ammonium from soil organic matter decomposition.
- Denitrification: Anaerobic conversion and loss of nitrate nitrogen to nitrite and nitrogen varieties of gases.
- Nitrification: An aerobic microbial process converting soil ammonium nitrogen to plant available nitrate.

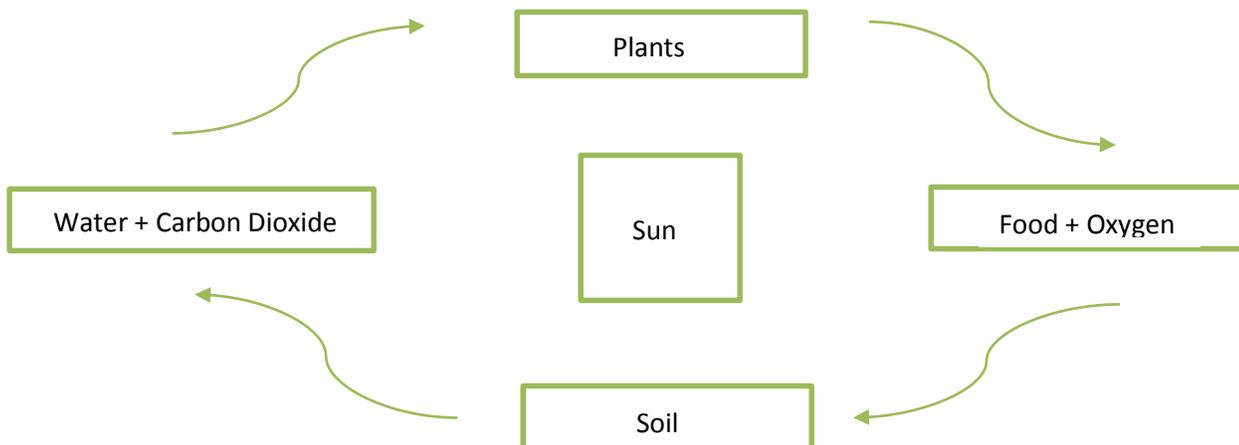

Demonstrate the Relevance – approximately 7 minutes

Instruct students to talk together and formulate ideas about how soil organic matter and respiration affect soil health.

Elicit responses, filling in the following information.

- Respiration rate can be based on the amount of soil organic matter present.
  - Soil organic matter is a food source for microbes and when microbes are present and working, respiration is higher.
  - When soil organic matter is absent or low, there is less decomposing activity.
  - Soil microbes are responsible for soil respiration and many important soil processes. (bacteria, fungi, protozoa, algae)
  - One heaping table spoon of soil can contain over 9 billion microbes.

Share the following diagram. Encourage students to complete the diagram in their guided notes.

Provide the Experience – Factors Affecting Soil Respiration – approximately 5 minutes

Instruct students to work in small groups. Provide each small group with one of the following factors that affect soil respiration. Instruct students to discuss how their group's factor might affect soil respiration.

Factors:

Climate

Biological activity

Soil moisture

Amount and quality of soil organic matter

Soil texture

Label the Information – approximately 10 minutes

- Climate
  - Cannot be changed
  - Affects temperature, moisture and indirectly affects biological activity
- Biological activity
  - Varies with the seasons and times of day
- Soil moisture
  - As moisture increases, respiration rates increase until the pores are overly saturated, resulting in lower oxygen content and lower soil organism respiration
  - 60% pore space saturation (field capacity) is ideal for respiration
  - Dry soils have low respiration rates because of less support for biological activities
- Amount and quality of soil organic matter
  - Affects microbe activity
- Soil texture
  - Clay – soil organic matter is “protected” from decomposition
  - Sand – too little organic matter
  - Medium texture (silt and loam) – favorable for soil respiration

### Demonstrate the Relevance – approximately 5 minutes

Facilitate a discussion with your students about the larger economic effects of poor soil respiration. Depending on the demographics of your students, use references that make sense to them – farming or from the stand point of a consumer. Consider using the following questions as a guide:

How can poor soil respiration affect a farmer whose income depends on the crop grown in that soil?  
How can poor soil respiration affect the prices we see for our food in the grocery store?

### Provide the Experience – Soil Respiration Management – approximately 3 minutes

Continue the facilitated discussion by asking the following question:

What do you think we can do as producers and consumers to ensure a productive soil respiration rate?

### Label the Information – approximately 7 minutes

#### Soil Respiration Management Practices

1. Leave crop residues on the soil surface.
  - a. Residues with low C:N ratios decompose faster than those with high C:N ratios
  - b. High residue crops + added Nitrogen = higher decomposition rates and accrual of organic matter
2. Use no-till practices.
  - a. Tilling practices decrease decomposition and accrual of organic matter
  - b. Minimize equipment use in fields
  - c. Minimize farm equipment use in general when soils are wet
  - d. Use designated locations for equipment traffic
3. Use cover crops.
  - a. Roots provide respiration
4. Add organic matter.
  - a. Nourishes microbes
5. Irrigate dry soil.

- a. Added water boosts the quality of the environment for microbes and therefore boosts soil respiration
- 6. Drain wet soil.
  - a. Too much water prevents microbes from being productive

Demonstrate the Relevance – approximately 15 minutes

Direct students to the following chart in their guided notes and instruct them to list some short term and long term impacts they can think of for each management practice and application. Use the key below to facilitate the discussion after a short time.

**Table 1. Interpreting management impacts on soil respiration and soil organic matter (SOM).**

Management Practice	Application	Short Term Impacts	Long Term Impacts
Solid manure or organic material application	Provide additional carbon and nitrogen source for microbes to breakdown and increase biomass production.		
High residue crops or cover crops used in rotation with high C:N ratio	High C:N ratio crops and added nitrogen increase decomposition and accrual of soil organic matter.		
Tillage such as annual disking, plowing, etc.	Stirs the soil providing a temporary increase in oxygen for microbes to break down carbon sources.		
Crop residue management	Leave residue on the surface increasing		

	ground cover to protect the soil.		
Nitrogen fertilizer or manure application	Provides nitrogen (energy) source for microbes to break down high C:N ratio residue quicker.		
Vehicle or farm equipment traffic	Compacts soil decreasing pore space, water movement, oxygen for microbes and nitrogen loss from denitrification		

<b>Management Practice</b>	<b>Application</b>	<b>Short Term Impacts</b>	<b>Long Term Impacts</b>
Solid manure or organic material application	Provide additional carbon and nitrogen source for microbes to breakdown and increase biomass production.	Increased respiration when manure begins to breakdown and increased biomass production.	Positive impact on soil structure, fertility and soil organic matter content.
High residue crops or cover crops used in rotation with high C:N ratio	High C:N ratio crops and added nitrogen increase decomposition and accrual of soil organic matter.	High C:N ratio crop residue tie up nitrogen temporarily in order to break down residue, increased soil moisture, decreased erosion.	Positive impact on long term soil quality, fertility and soil organic matter content.
Tillage such as annual disking, plowing, etc.	Stirs the soil providing a temporary increase in oxygen for microbes to break down carbon sources.	Provides a flush of nitrogen, other nutrients and carbon dioxide release immediately after tillage. Increases erosion rates, decomposition rate of	Declines in soil organic matter, soil quality, soil fertility.

		residue, and other carbon sources.	
Crop residue management	Leave residue on the surface increasing ground cover to protect the soil.	Increased crop residue cover can tie up nitrogen temporarily in order to break down residue, increased soil moisture, decreased erosion and cooler soil temperatures.	Positive impact on long term soil quality, fertility and soil organic matter content.
Nitrogen fertilizer or manure application	Provides nitrogen (energy) source for microbes to break down high C:N ratio residue quicker.	Temporary increase in respiration due to increased rate of breakdown of organic materials.	When managed correctly has an overall positive impact on soil organic matter and soil quality by increasing production levels and residue amounts.
Vehicle or farm equipment traffic	Compacts soil decreasing pore space, water movement, oxygen for microbes and nitrogen loss from denitrification.	Decreases respiration, yields, water infiltration and increases runoff.	Production declines, increased soil erosion and runoff, decreased soil quality, compacted soils and reduced microbial activity.

Provide the Experience – Measure and Interpret Soils Respiration – approximately 90 minutes

Introduce each of the laboratory supplies to the students and review the laboratory processes and procedures with the class. See the guided notes lab for information.

Students engage in the lab activity.

Label the Information – time varies

Students record information and answer lab questions.

Demonstrate the Relevance – time varies

Discuss with students how their activities affect soil respiration rates.

Review the Content – 7 minutes

Instruct students to work in small groups to create a jingle that includes a minimum of three facts they learned during the soil respiration lesson and laboratory activity. Students share their jingle with the class.

- Soil moisture
- Amount and quality of soil organic matter
- Soil texture

#### Soil Respiration Management Practices

1. Leave crop residues on the soil surface.
2. Use no-till practices.
3. Use cover crops.
4. Add organic matter.

5. Irrigate dry soil.

6. Drain wet soil.

**Table 1. Interpreting management impacts on soil respiration and soil organic matter (SOM).**

<b>Management Practice</b>	<b>Application</b>	<b>Short Term Impacts</b>	<b>Long Term Impacts</b>

# Guided Notes: Soil Respiration Laboratory

## Soil Respiration Scenario

Tom and Molly are troubled about the performance a field they recently purchased and planted to corn. The field was highly tilled with little crop residue. The equipment used on the field by the prior owner had very narrow tires, and there is no consistent path used for traveling to the irrigation pad. They are curious about what might be the problem and plan to test the soil respiration rate today.

## Laboratory Supplies

- Solvita® sample jar for correct volume of soil or a 3-inch diameter aluminum cylinder and lid
- Foil-pack containing a special gel paddle
- Solvita ® key for reading results
- Solvita ® interpretation guide to estimate differences in soil quality, respiration and potential nitrogen release
- Aluminum foil or cap when aluminum cylinder is used
- Solvita ® soil life respiration test (paddles)
- Soil thermometer or controlled room temperature
- Small plastic bucket for each group of students
- Baggies with a zipper closure

## Laboratory Steps

When soils are mixed, respiration temporarily increases because of the aeration caused by mixing. This is similar to the temporary increase in respiration caused by tillage. As oxygen availability increases, organic matter breaks down quicker.

Consider using an intact soil core in the 3-inch diameter aluminum cylinder rather than mixing soil. An intact core better reflects respiration for no-till applications, while a mixed sample will better reflect respiration either immediately after tillage or post tillage (at least 1 day after mixing). To get an accurate comparison of different management systems, several soil samples representing different management systems can be compared.

## Step-by-Step Procedure

1. Soil Sampling

Gather a minimum of 10 small samples from an area that represents similar soil type and management history with a probe from the surface 0-6 inch depth. Place the samples in the small plastic bucket. Repeat this step for each sampling area.

(Soil respiration is variable both spatially and seasonally and is strongly affected by organic matter, manure applications, oxygen levels, soil moisture, salinity and soil temperature. Use fresh soil samples, gathered just before the test.)

2. Mixing

Mix soil in the plastic bucket just well enough to be homogeneous and remove roots, residue, large stones and residues from sample and place in a labeled plastic zip bag.

3. Add Water if Needed

The sample should have idea moisture (near field capacity) for growing conditions. If field conditions are dry it is best to add water 24 hours prior to sampling. If needed, water can be added prior to starting the test in the classroom.

4. Put Sample Into Solvita® Jar

Shortly after sampling put moist mix of soil up to fill line in the Solvita® jar. As you fill, tap the bottom of the jar on a hard surface to ensure there are no voids.

5. Use the Color Gel

Insert color gel paddle into soil with the gel facing out next to the clear side of the jar. Be careful not to jostle or tip the jar. Screw the lid on very tightly and record the time on the lid. Keep the jar in the classroom at a controlled temperature of 68-75 degrees Fahrenheit and out of sunlight for 24 hours.

6. Read and Record Results

Read gel color after 24 hours and record results on Table 3.

7. Answer discussion questions and complete interpretations section of Table 3. Refer to Solvita® soil test instructions for additional information and interpretations.

## Interpretations

Respiration levels reflect soil health based on the level of carbon dioxide respiration. Rates are impacted by the quality of soil, soil organic matter content, and can be used to approximate quantity of nitrogen released per year in an average climate. The rate of carbon dioxide released is expressed as CO<sub>2</sub>-C lbs/acre-3"/day.

High soil respiration rates are indicative of high biological activity. This can be a good sign of a healthy soil that readily breaks down organic residues and cycles nutrients needed for crop growth.

Solvita® response may go from an inactive condition (0-1 blue-gray) to a very active state (3.5-4.0 green-yellow) as soil respiration increases from desirable management measures such as diverse crop rotations, and no-till. In some cases, heavily maured soils or soils high in organic content can attain a very high rate (5 yellow). This can be detrimental when decomposition of stable organic matter occurs. It is generally desirable to have at least green color 3. It typically takes several years for a soil to improve from a low biological status to a more active one. With proper residue management, diverse crop rotations, organic matter additions and avoidance of destructive tillage practices, the time to reach a more optimum condition is shortened.

**Table 2. Basic soil biological quality.**

Color/Colorimetric Number				
0-1 Blue-Gray	1.0-2.5 Gray-Green	2.5-3.5 Green	3.5-4.0 Green-Yellow	4-5 Yellow
Soil Respiration Activity				
Very Low Soil Activity	Moderately Low Soil Activity	Medium Soil Activity	Ideal Soil Activity	Unusually High Soil Activity
Associated with dry sandy soils, and little or no organic matter	Soil is marginal in terms of biological activity and organic matter	Soil is in a moderately balanced condition and has been receiving organic matter additions	Soil is well supplied with organic matter and has an active population of microorganisms	High/Excessive organic matter additions
*Approximate Level of CO <sub>2</sub> - Respiration				
<300 mg CO <sub>2</sub> /kg soil/wk	300-500 mg CO <sub>2</sub> /kg soil/wk	500-1000 mg CO <sub>2</sub> /kg soil/wk	1000-2000 mg CO <sub>2</sub> /kg soil/wk	>2000 mg CO <sub>2</sub> /kg soil/wk
<9.5 lbs CO <sub>2</sub> -C/acre-3” d	9.5-16 lbs CO <sub>2</sub> -C/acre-3”d	16-32 lbs CO <sub>2</sub> -C/acre-3”d	32-64 lbs CO <sub>2</sub> -C/acre-3”d	>64 lbs CO <sub>2</sub> -C/acre-3” d
Approximate Quantity of Nitrogen (N) Release Per Year (Average Climate)				
<10 lbs/acre	10-20 lbs/acre	20-40 lbs/acre	40-80 lbs/acre	80->160 lbs/acre
