WELCOME TO THE 2016 SPRING SEED GUIDE

Corn and soybeans are included in this seed guide. Individual plot data for regions is available on the web at http://cropwatch.unl.edu/varietytest/corn for corn and http://cropwatch.unl.edu/varietytest/soybeans for soybeans. It is our hope that you will find this guide useful in making hybrid and variety selection for planting this spring. Please send any comments and suggestions to tregassa2@unl.edu.

Please visit our web site at http://cropwatch.unl.edu/varietytest for all the information you need on varietytesting.

NEBRASKA VARIETY AND HYBRID TESTS

SPRING SEED GUIDE – 2016

- November 2015 -

AUTHORS

Teshome H. Regassa.....Department of Agronomy/Horticulture, Lincoln, NE

Charles Shapiro…….....……..……Department of Agronomy/Horticulture, Concord, NE

ACKNOWLEDGMENTS

This circular is a progress report of variety trials conducted by personnel of the Agronomy Department, and Northeast Extension Centers, and their associated agricultural laboratories. Conduct of experiments and publication of results is a joint effort of the Agricultural Research Division and the Cooperative Extension Service. Fees paid by commercial seed companies partially supported the tests reported in this report.

Farmers furnished land for the experiments and this is highly acknowledged. The help of extension educators and others who assisted with the tests is acknowledged as well.

The authors wish to acknowledge the assistance of the technical support staff: Neal Mattox, Jeff Golus, Michael Mainz, Madhav Bhatta, and Po Yu Chen. Their help is vital to this research.

NEBRASKA CORN HYBRID TESTS

CROP PRODUCTION SUMMARY

According to the National Agricultural Statistics Service, there were 9 million acres of corn harvested in Nebraska in 2015 producing approximately 1.683 billion bushels of grain. The total average corn yield for Nebraska in 2015 was a record 187 bushels per acre (bu/a). Total corn yields from the previous 10 years are reported below.

Average Nebraska Corn Yield (Last 10 Years)

Year	2005	2006	2007	2008	2009	2010	2011	2012	2013	2014	2015
Yield (bu/a)	154	152	160	163	178	166	160	142	169	179	187

Source: NASS

Detailed information regarding crop progress and history can be obtained from the National Agricultural Statistics Service available online at http://www.nass.usda.gov

PROCEDURE

Nine corn performance tests were planted in eastern and northeastern Nebraska in 2015. Corn trials are conducted to provide yield and other information about corn hybrids available to corn growers in Nebraska. A fee from seed companies covers a portion of the cost of each test. Entry was on a voluntary basis and hybrids were selected by seed producers. At many locations, widely grown hybrids were entered by the Agronomy/Horticulture Department or the cooperator.

Individual plots are two rows wide and range from 15 to 35 feet long. Each test location had the same number of seed planted for all hybrids. The plant population represents the average harvested plant density. Grain yields are expressed on a 15.5% moisture basis. Yields shown are averages of four or more replicated plots at each location. Plots were machine harvested and grain moisture determinations were made with an electronic moisture meter or moisture sensors on the combine.

Variations in soil fertility, moisture conditions, and other factors are found in each test area. This makes it impossible to measure yielding ability of hybrids with absolute accuracy. For this reason, small yield differences have little meaning. A statistical measure of differences required for significance is given in each table (LSD). These differences are computed at the 5% level of significance. At the 5% level, a difference of that magnitude would be expected once in twenty trials through chance alone. Most fields have some degree of spatial variability. We make every effort to remove the variability by blocking and using other experimental design methods. We also use statistical procedures to remove a portion of the spatial variability.

In these experiments, many hybrids statistically had the same grain production. Performances of hybrids vary with seasonal conditions. Great care should be used in interpreting the results of a single year test. Earlier maturing hybrids are favored in some seasons while later ones perform best in other years. In addition, some hybrids are able to withstand unfavorable weather conditions better than others which may do well under ideal growing conditions. Performance over a period of years should give a much better measure of adaptation whenever available. Harvest moisture, stalk strength, and resistance to insect and disease also are factors which must be considered in selecting hybrids.

Relative hybrid performance often varies with locations within zones. In zone analysis, the hybrid by location mean square was used to calculate the differences required for significance shown in the tables. Moisture at harvest is an important consideration in hybrid selection as it does affect time of harvest and drying costs although this year the grain was all quite dry at harvest.

RESULTS AT INDIVIDUAL LOCATIONS

Southeast District:

Rainfed tests were planted in Butler, Gage and Otoe Counties.

- The Butler County rainfed test was planted on May 3rd and harvested on November 8th, with an average yield of 253bu/a. There were 26 varieties entered in this rainfed test including one farmer entry: (A) Golden Harvest G11U58 (treated w/ Commence), (B) Dekalb 63-55 RIB.
- The Gage County rainfed test was planted on May 2nd and harvested on November 5th with an average yield of 191bu/a. There were 28 varieties entered in this rainfed test including three farmer entries: (A) Dekalb 61-89, (B) Dekalb 62-77, (C) Dekalb 63-55, (D) Dekalb 65-79.
- The Otoe County rainfed test was planted on May 3rd and harvested on November 4th with an average yield of 232 bu/a. There were 28 varieties entered in this rainfed test including two farmer entries: (A) Hoegemeyer 7900, (B) Hoegemeyer 8066AM, (C) Hoegemeyer 8294, (D) Hoegemeyer 8654.

Irrigated tests were planted in Clay, Hamilton and York Counties

- The Clay County irrigated test was planted on May 2nd and harvested on November 7th with an average yield of 283 bu/a. There were 30 varieties entered in this rainfed test including four farmer entries: (A) Pioneer 0876CHR, (B) Pioneer P1311 AMXT, (C) Pioneer P1690 CHR, (D) Pioneer P9690AM.
- The Hamilton County irrigated test was planted on May 3rd and harvested on November 4th with an average yield of 328 bu/a. There were 30 varieties entered in this rainfed test including four farmer entries: (A) Pioneer 0876CHR, (B) Pioneer P1311 AMXT, (C) Pioneer P1690 CHR, (D) Pioneer P9690AM.
- The York County irrigated test was planted on April 30th, however the plots were harvested by the farm crew and there is no data available.

North/Northeast District:

Three tests were planted in Dixon and Holt Counties

- The Dixon County irrigated test was planted on May 13th and harvested on November 10th with an average yield of 233bu/a. There were 12 varieties entered in this irrigated test including two farmer entries: (A) Mycogen 2V717E, (B) LG 5524VT3
- The Dixon County rainfed test was planted on May 13th and harvested on October 27th with an average yield of 203bu/a. There were 12 varieties entered in this rainfed test including two farmer entries: (A) Mycogen 2V717E, (B) LG 5524VT3
- The Holt County rainfed test was planted on May 13th and harvested on November 10th with an average yield of 247bu/a. There were 17 varieties entered in this rainfed test including two farmer entries: (A) Mycogen 2V717E, (B) LG 5524VT3

CULTURAL PRACTICES

Butler County: Rainfed; Previous crop: Soybean; No-till; Fertilizer: 140 lb NH3; 5 gal 9-18-9; 125 lb 11-52-0; Herbicide: Pre = 4oz Corvus + 1 pt Atrazine; Post = 32oz glyphosate; Fungicide: 10 oz Quilt Xcel

Clay County: Irrigated; Previous Crop: Soybean; Conventional; Fertilizer: 100 lb 11-52-0 (Jan'15), 180lb NH3 (March '15), RoundupMax+AMS@ 40 oz/ac burndown, 3 qt/ac fo Lexar EZ pre-emergence.

Dixon County (Irrigated): Irrigated; Previous crop: Corn; Conventional; Fertilizer: 150lb NH3; Herbicide: Pre = Keystone NXT (2.5 qt/a); Post = Durango DMA (32 oz/a) + water conditioner (2 Qt/100 gal soln.)

Dixon County (Rainfed): Rainfed; Previous crop: Corn; Conventional; Fertilizer: 150lb NH3; Herbicide: Pre = Keystone NXT (2.5 qt/a); Post = Durango DMA (32 oz/a) + water conditioner (2 Qt/100 gal soln.).

Gage County: Rainfed; Previous crop: Soybean; No-till; Fertilizer: 100 lb N, 40 lb P, 8 lb S, 0.25 lb Zn; Herbicide: Pre = 2,4-D + atrazine; Post = Halex GT + atrazine

Hamilton County: Pivot irrigated; Previous Crop: Soybean; No-till; Fertilizer: 210 lb N, 5 gal/ac starter; Herbicide: SureStart and atrazine (1 qt/ac of each; Fungicide: 5 oz/ac Headline

Holt County: Irrigated; Previous crop: Soybean; No-till; Fertilizer: 198 lb N, 24 lb P2O5, 15 lb S; Herbicide: Pre = burndown: Bicep, 2,4-D, Sharpen, MSO; Post = Halex GT, Ultra Lite

Otoe County: Rainfed; Previous Crop: Soybean; No-till; Fertilizer: 180 lb NH3; Herbicide: Pre planting: 2,4-D 1 pt/ac + Degree/Xtra 1.5 qt/ac + Atrazine 0.5 qt/ac + Traxion 1 pt/ac. Post emergence: Ammonium Sulfate 2.5lb/ac + Callisto 2 oz/ac + Traxion 3 pt/ac.

NEBRASKA SOYBEAN VARIETY TESTS

- 2015 -

CROP PRODUCTION SUMMARY

According to the *National Agricultural Statistics Service*, there were 5.25 million acres of soybeans planted in Nebraska in 2015. 5.2 million acres were harvested producing around 291 million bushels. The average soybean yield for all production practices in Nebraska for 2015 was 56 bushels per acre(bu/a). Soybean yields from the previous 10 years are reported below.

Average Nebraska Soybean Yield (Last 10 Years)

Year	2005	2006	2007	2008	2009	2010	2011	2012	2013	2014	2015
Yield (bu/a)	50.5	50	51	46.5	54.5	53	53	41	52	54	56

Source: *National Agricultural Statistics Service* (http://www.nass.usda.gov)

Detailed information regarding crop progress and history can be obtained from the *National Agricultural Statistics Service* available online at http://www.nass.usda.gov.

PROCEDURE

Ten soybean yield trials were planted at five locations in spring of 2015. All entries were privately developed varieties entered by an industry representative. Farm entries were selected by the cooperating farmer. Soil type of testing sites and cultural practices applied are shown in Table B. At three locations entries were divided into early and late maturing varieties for convenience in handling. Average performances of entries for key agronomic and quality characteristics are shown in Table C. A list of entries by brand name is shown in Table D, while details about each hybrid are shown on Table E. Names and addresses of entrants and corresponding contact addresses are listed in Table F.

Entries were planted in four-row plots 15 to 35 feet long. Plots were replicated four times in a randomized complete block design. A planting rate of 8.5 seeds per foot in 30-inch rows (148,100 seeds per acre) was used.

Two center rows 10 to 30 feet long were threshed for yield. Reported yields are corrected to 13% moisture. Plots were rated mature when 95% of the pods had reached their mature pod color when maturity is taken. Most often, five to ten days of drying weather are required after “maturity” before the soybeans have less than 15% moisture.

Protein and oil content is reported on a 13% moisture basis and will appear lower than many reported figures. Conversions can be made to 0% by multiplying the protein or oil by 1.13. Estimated Processed Value (EPV) is calculated from the protein and oil content from the Chicago Board of Trade prices for soybean oil and 48% protein soybean meal . EPV is calculated on an acre basis by multiplying the yield (bu/acre) by the EPV/bu.

PERFORMANCE

Performance of entries cannot be measured with absolute accuracy in one season because of variations in moisture, soil fertility and other factors. Also, most fields contain some spatial variability. Because of the many sources of variability, small yield differences have little significance. Differences required for significance are shown in each table at the 5% level. This means that differences this great would be expected through chance alone in 1 of 20 trials. A simple way of thinking of these differences is that if all the plots had been the same variety that would be the difference that would have been measured. Many soybean varieties have similar yield potentials. Early maturing varieties are favored in some seasons and later maturing varieties in others. Zone averages and period-of-years averages provide a measure of performance over a range of environmental conditions.

Period-of-years data for varieties include two, and three-year averages. It should be noted that with the rapid development and turnover of varieties, very few varieties have more than one year averages. We encourage you to use data from many sources in comparing soybean varieties.

RESULTS AND MANAGEMENT AT INDIVIDUAL LOCATIONS

East/South Central District:

Four tests were planted at two locations in Clay, Lancaster, and Saunders Counties:

- The Clay County irrigated early and late tests were planted on May 22nd. This site was harvested October 15th with the 7 early maturing entries averaging 68 bu/a and the 21 late maturing entries averaging 72 bu/a.
- The Saunders County irrigated early and late tests were planted on May 23rd into a conventionally tilled field. This test was harvested October 19th with the 7 early maturing entries averaging 50 bu/a and the 21 late maturing entries averaging 68 bu/a.

Southeast District:

There were two tests (early set and late set) at one location in Saline County:

- The Saline County rainfed test was planted May 19th and harvested October 13th. This site utilized a no-till system and was planted into corn residue. The early maturing test had 12 entries and averaged 49 bushels per acre. The late maturing test had 22 entries and averaged 55 bushels per acre.

Northeast District:

There were four tests planted at two seperate locations in Dixon County.

- The Dixon County rainfed early and late tests were planted May 30th and harvested on October 12th with an average yield of 62 bu/a for 4 early entries and 62 bu/a for 10 late entries.
- The Dixon County irrigated early and late tests were planted May 29th and harvested on October 12th with an average yield of 62 bu/a for 4 early entries and 63 bu/a for 10 late entries.

Central District:

Two tests were planted at two locations in Dawson and Lincoln Counties.

- The Dawson County irrigated test was planted May 12th and harvested on October 12th with an average yield of 83 bu/a for 16 entries.
- The Lincoln County irrigated test was planted May 13th and harvested on October 12th with an average yield of 73 bu/a for 16 entries.

LibertyLink:

There were three LibertyLink trials planted in Clay, Saunders, Lancaster Counties.

- The Saunders County irrigated test was planted on May 23rd into a conventionally tilled field. This test was harvested October 19th with 12 entries averaging 53 bu/a.
- The Lancaster County rainfed test was planted on May 23rd into a conventionally tilled field. This test was harvested October 20th with 12 entries averaging 60 bu/a.
- The Clay County irrigated test was planted on May 22nd into a no-till field. This test was harvested October 15th with 11 entries averaging 71 bu/a.
