2017 FALL SEED GUIDE

Brought to you by the
University of Nebraska Variety
Testing Program

- University of Nebraska–Lincoln Extension
- Institute of Agriculture and Natural Resources
- Department of Agronomy & Horticulture

Extension is a Division of the Institute of Agriculture and Natural Resources at the University of Nebraska–Lincoln
cooperating with the Counties and the United States Department of Agriculture.

University of Nebraska–Lincoln Extension educational programs abide with the nondiscrimination policies of the
University of Nebraska–Lincoln and the United States Department of Agriculture.

WELCOME TO THE 2017 FALL SEED GUIDE

Crops included in this guide are winter wheat, winter barley, and triticale. The data and other information this guide is based on can also be found at the University of Nebraska Variety Testing web site: <http://cropwatch.unl.edu/varietytest>. Additional wheat variety information may be found at the wheat variety virtual tour web site: <http://cropwatch.unl.edu/wheat/virtual> or the wheat crop web site: <http://cropwatch.unl.edu/wheat>.

The overall winter wheat growing conditions for the past season were very good. Precipitation was greater than in previous years and rainfall was distributed evenly throughout the season except in some instances. There was a surprise late (April, 30) storm with heavy snow that blanketed the western part of the state. The heavy snow matted down some of the fields but the crop generally recovered except for some tip burning and with few exception did actual freeze injury observed later at heading. The storm didn't significantly affect the overall health of the crop rather the snow/rain was helpful in releasing moisture stress for some locations.

Farmers sprayed fungicide for leaf disease at most locations. Spraying for disease along with relatively good moisture condition during grain filling resulted in some good wheat across the state. However, incidence of growers cutting and baling their wheat due to severe disease damage was also reported elsewhere.

For most variety testing sites, cooperating farmers used more inputs (fertilizer, herbicide, fungicides) compared to earlier years. The favorable growing conditions and increased management inputs (at least for test locations) may have resulted in record-high yield reports for most state variety testing locations. As expected, increased input may have predisposed some varieties to lodging. The lodging at some other locations could also be attributed to shallow depth of planting from dry planting conditions in the west. Crop emergence was reported poor to average for most of the sites in the west as well.

Yield and quality parameters were very good for all of the test plots compared to earlier years. Harvesting was however, complicated at some locations by late season storms and hail. All plots were harvested except the irrigated trial in Box Butte County. The plot results from the trial in Furnas County were discarded due to inconsistency probably resulting from early season hail damage.

I hope you will find this seed guide helpful in selecting winter wheat varieties for your wheat operation or use the data to advise your clientele in choosing the right variety to grow.

- Teshome Regassa, Ph. D.

UNL EXTENSION CIRCULAR 103

FALL SEED GUIDE

- August 2017 -

AUTHORS

Teshome Regassa.....	Department of Agronomy/Horticulture; Lincoln
P. Stephen Baenziger.....	Department of Agronomy/Horticulture; Lincoln
Rodrigo Werle.....	West Central Research and Extension Center; North Platte
Dipak Santra.....	Department of Agronomy/Horticulture; Scottsbluff

ACKNOWLEDGMENTS

This circular is a progress report of variety trials conducted by personnel of the Agronomy Department, West Central, and Panhandle Research and Extension Centers and their associated agricultural laboratories. Conduct of experiments and publication of results is a joint effort of the Agricultural Research Division and the Cooperative Extension Service. Tests were supported in part by fees paid by commercial seed companies and a partial funding from the Nebraska Wheat Board.

Special acknowledgment is made to farmer cooperators who furnished land for the experiments; also to Extension Educators and others who assisted with the tests. The authors wish to acknowledge the assistance of the technical support staff: Brian Maust, Greg Dorn, Vern Florke, Mitch Montgomery, and Liberty Daniels. Their help is vital to this research.

We would like to thank the Nebraska Wheat Board for contributing wheat check-off money and the Nebraska Agricultural Statistics Service for compiling data on varieties and production of wheat.

This circular reports data from winter wheat trials conducted throughout the State of Nebraska. Entries include commercial varieties and promising experimental lines from Nebraska, surrounding states, and private seed company breeders. The state has been divided into four districts for the purposes of variety testing (Panhandle, West Central, South Central, and Southeast).

There were 16 trials planted across Nebraska in the fall of 2016. Data from the Furnas Rainfed site was not collected due to hail damage. Box Butte County irrigated trial near Hemingford was not harvested due to complications of machinery and rain. Names of cooperators, trial locations, planting dates, harvest dates, highest location mean yield, and mean of top five varieties are shown in Table A. Location specific information such as soil type, tillage, previous crop, and fertilizer applications when available are shown in Table B. Plot sizes varied with location. Four to six row wide and 20 to 35 feet long plots were planted across locations. All tests were direct combined. Entries were replicated 3 to 6 times.

Protein and seed size data were collected from two replicates at each location. The protein data was combined within each district and reported in the district tables. Protein was determined from whole grain using a Perten DA 7250 Near Infrared Spectrometer. Please refer to the Variety Test Home Page for individual site yields, disease score, and other relevant information.

WINTER WHEAT PERFORMANCE

According to the National Agricultural Statistics Service, winter wheat was sown on 1.1 million acres. 1.0 million acres were harvested producing a projected 46 million bushels of grain. The average winter wheat yield of Nebraska for all wheat harvested during the summer of 2017 was projected to be 46 bushels per acre (bu/a). Winter wheat yields and production from the previous 10 years are reported below.

Average Nebraska Winter Wheat Yield (all practices)

Year	2008	2009	2010	2011	2012	2013	2014	2015	2016	2017
Yield (bu/a)	44	48	43	44	42	35	49	42	50	46
NE Total Production (million bu)	73.48	76.8	64.07	65.25	55.44	41.76	71.05	54.6	60	46

Source: National Agricultural Statistics Service (<http://www.nass.usda.gov>)

Yielding ability of different varieties cannot be measured with absolute accuracy because of variations in local disease incidence, soil fertility, seasonal rainfall or moisture, and other factors. For this reason, small differences in yield have no significance. Unless the difference in yield of two varieties is greater than the difference required for significance shown in the tables, little confidence can be placed in the superiority of one variety over the other for measured traits in that particular test. These differences are shown at the 5% level, meaning that differences as large or larger could be expected through chance alone in 1 of 20 trials (5%). Even though two varieties are not statistically different, there may be other factors which influence the choice of one over the other. Factors such as disease resistance, grain quality, agronomic desirability or availability of seed may influence that decision.

Complementary varieties are important when selecting additional varieties to grow. One definition of complementary varieties is that they come from diverse parentages. A more in depth discussion of variety complementation is found in the Crop Improvement section. In order to help select varieties with diverse parentages, the related families of many varieties are included in the characteristics chart.

RESULTS AT INDIVIDUAL LOCATIONS

Southeast:

There were five rainfed trials conducted in the Southeast District in Saunders, Lancaster, Clay, Jefferson, and Washington counties. Site specific management and previous crops are shown in Table B.

- The Jefferson County Rainfed trial was planted on October 18th into soybean stubble. 100 lb/ac N as 28-0-0 and 17 lb/ac S as Thiosol were applied in March. 0.75 oz/ac Harmony Extra SG herbicide and 4 oz/ac Bumper fungicide were broadcast on in late March before jointing, while 1 gal/ac N-Cline fertilizer and 14 oz/ac Quilt XL fungicide were aerially applied at flag leaf, and 8.2 oz/ac Prosaro fungicide was applied at full heading. Plots were harvested on July 10th with a top yield of 126 bu/ac and an average yield of 108 bu/ac. The Saunders County Rainfed trial was planted on October 5th, previous crop was oats. A total of 80 lb UAN was applied. Plots were harvested on July 1st with a top yield of 92 bu/ac and an average yield of 71 bu/ac. 0.4 oz/ac Finesse herbicide was applied.
- The Saunders County Rainfed trial was planted on October 18th, where the previous crop was oats. A total of 80 lb/ac N was applied. Plots were harvested on July 11th with a top yield of 105 bu/ac and an average yield of 87 bu/ac. 0.33 oz/ac Finesse herbicide was applied. The Clay County Rainfed trial was planted on September 18th. Plots were planted September 18th and harvested on July 13th with a top yield of 68 bu/ac and an average yield of 44 bu/ac. A total of 60 lb/ac 11-52-0 was applied as a starter and 50 lbs/ac N was applied as top-dress in the spring.
- The Lancaster County Rainfed trial was planted on September 29th into ground previously planted in oats. 60 lb/ac dry N was applied in Sept & 80 lb/ac liquid N in March. Plots were harvested on July 7th with a top yield of 121 bu/ac and an average yield of 93 bu/ac. Prowl H2O + 2, 4-D herbicide was applied for weed control.
- The Washington County Rainfed trial was planted on October 11th into soybean stubble. 100 lb/ac N, 60 lb/ac K20, 45 lb/ac Cl, and 15 lb/ac S were top-dressed prior to jointing. Plots were harvested on July 17th with a top yield of 140 bu/ac and an average yield of 111 bu/ac. 6.5 oz/ac Prosario was applied at Feekes 10.5.1.

South-Central:

- The Clay County Rainfed trial was planted on September 22nd and harvested on July 18th with a top yield of 85 bu/ac and an average yield of 72 bu/ac. A total of 60 lb/ac 11-52-0 was applied as a starter fertilizer.

West Central:

Six locations were planted in the West Central District. One irrigated trial was planted in Chase County. Rainfed trials were planted in Red Willow, Furnas, Keith, Lincoln, and Perkins counties. Furnas plots were not harvested due to hail damage. Most rainfed sites were left fallow during the previous growing season with corn as the crop before (Table B).

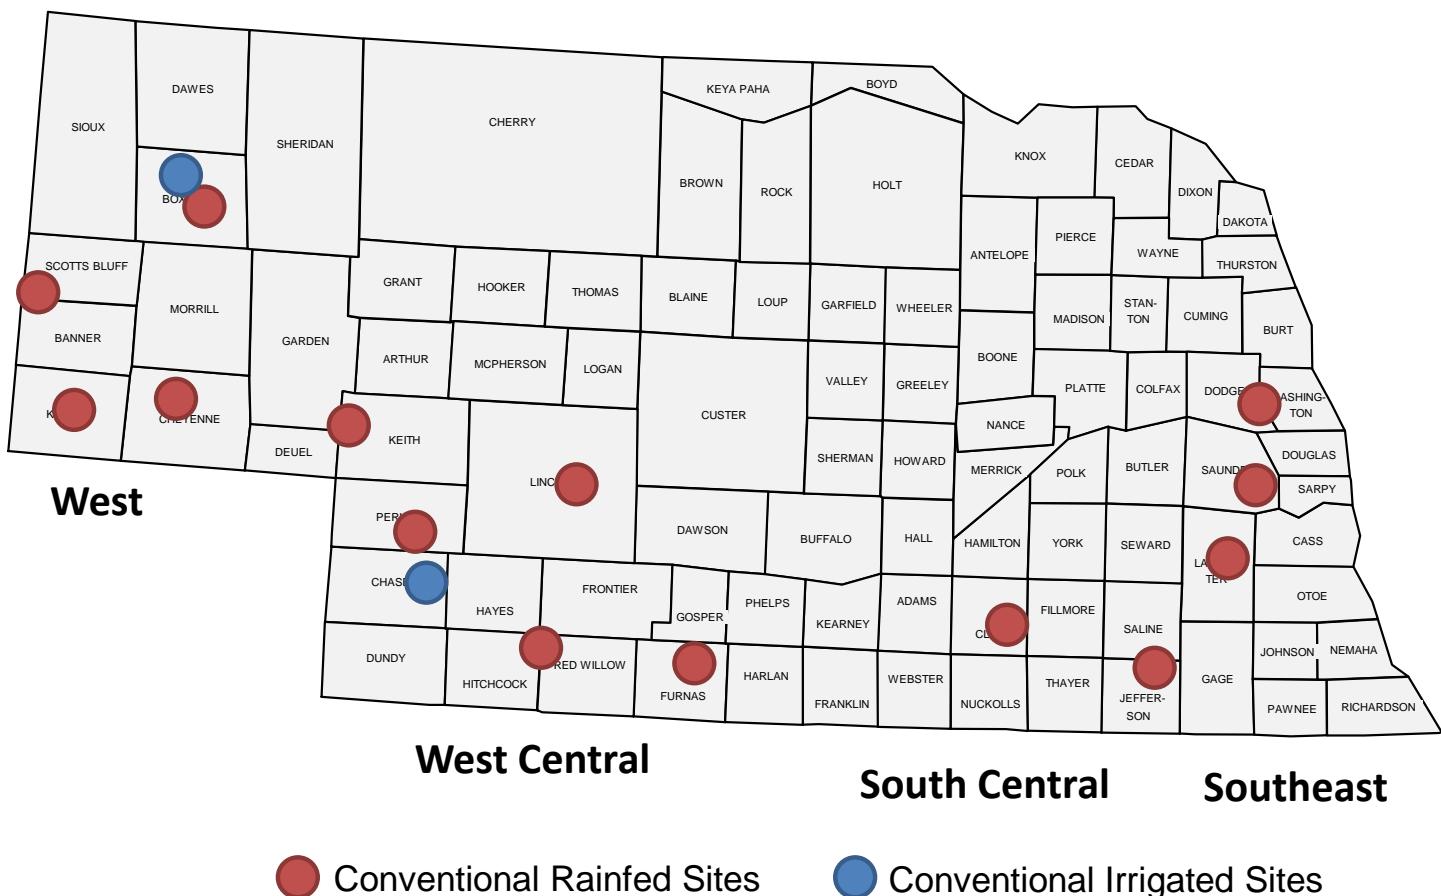

- The Chase County Irrigated trial was planted on October 14th into ground previously cropped in potatoes. Plots were harvested on July 12th with a top yield of 123 bu/ac and an average yield of 98 bu/ac.
- The Keith County Rainfed trial was planted on September 20th into no-till fallow ground. 5 gal/ac of 10-34-0 fertilizer was applied. Plots were harvested on July 13th with a top yield of 81 bu/ac and an average yield of 69 bu/ac.
- The Red Willow County Rainfed trial was planted on September 22nd into no-till fallow ground. Plots were harvested on July 11th with a top yield of 108 bu/ac and an average yield of 71 bu/ac. 0.35 oz/ac of Amber + Banvel herbicide was applied for weed control.
- The Lincoln County Rainfed trial was planted on September 20th into no-till fallow ground. 60 lb/ac of 32-0-0 fertilizer was applied. Plots were harvested on July 8th with a top yield of 76 bu/ac and an average yield of 61 bu/ac. Amber herbicide at 0.35 oz/ac and 4.0 oz/ac Tebucur (Stripe Rust) were also applied.
- The Perkins County Rainfed trial was planted on September 23rd into no-till fallow ground with 70 lb/ac of N applied in the spring in the form of 32-0-0. Plots were harvested July 14th with a top yield of 60 bu/ac and an average yield of 43 bu/ac. Also 6.88 oz/ac PowerFlex + 8 oz/ac 2,4D herbicide and 4.0 oz Sieze (Stripe Rust) were applied.

West (Panhandle):

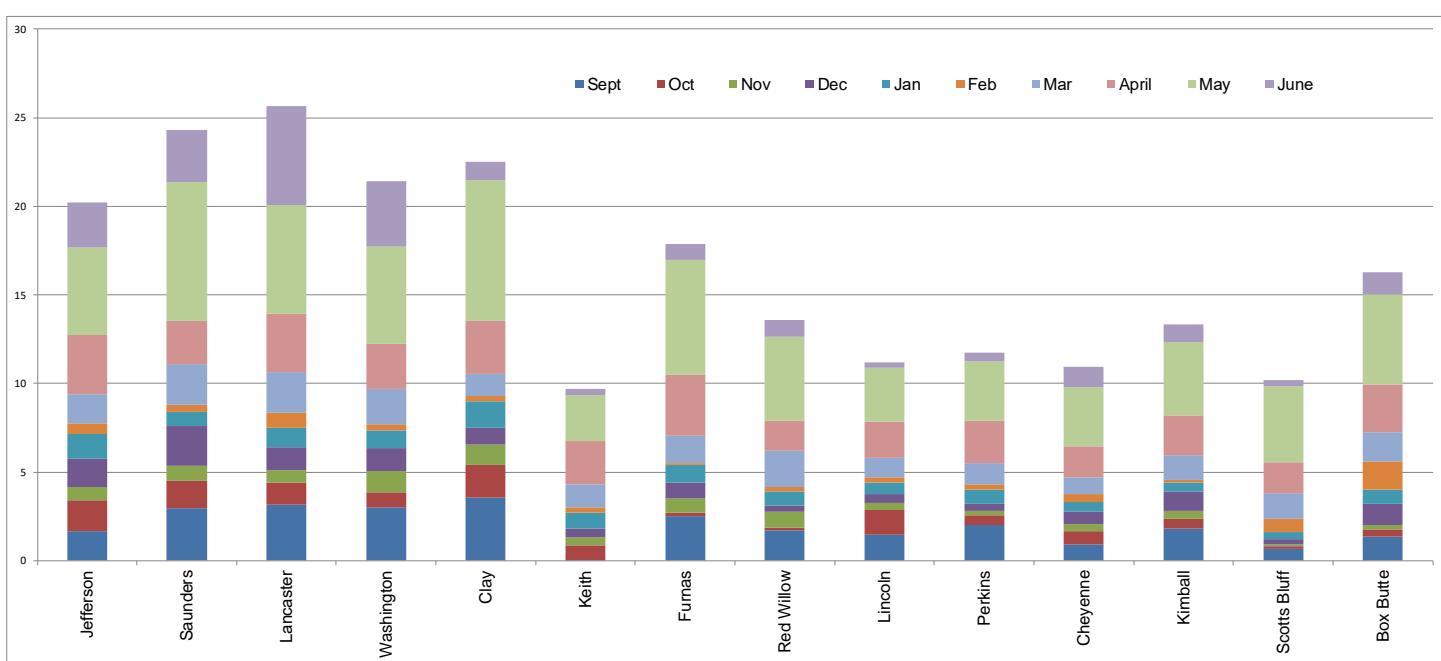

Five locations were planted in the West (Panhandle District). One irrigated trial was planted in Box Butte County. Rainfed trials were planted in Box Butte, Cheyenne, Kimball, and Scotts Bluff. All rainfed sites were left fallow the previous year with millet or wheat being the previous crop. Convention tillage practices were used at all locations (Table B).

- The Box Butte County Irrigated trial was planted on September 18th. Plots were not harvested.
- The Cheyenne County Rainfed trial was planted on September 13th. Seed was sown into conventionally-tilled soil. A total of 50 lb/ac N was applied in late spring of 2016 and 25 lb/ac N as a 2017 spring topdress. Plots were harvested on July 8th with a top yield of 102 bu/ac and an average yield of 75 bu/ac. 8 oz/ac LV6 herbicide and 2.56 oz/ac Lamba insecticide were applied.
- The Kimball-Deuel County Rainfed trial was planted on September 19th into conventionally-tilled soil. 50 lb/ac N fertilizer was applied in the fall & 30 lb/ac N as a spring topdress. Plots were harvested on July 20th with a top yield of 75 bu/ac and average yield of 64 bu/ac.
- The Scotts Bluff Rainfed trial was planted on September 14th. Seed was sown into conventionally-tilled soil. Plots were harvested on July 21st with a top yield of 54 bu/ac and an average yield of 47 bu/ac.
- The Box Butte County Rainfed trial was planted on September 12th. Plots were harvested on July 19th with a top yield of 86 bu/ac and an average yield of 70 bu/ac.
